

JControl/SmartDisplay

JAVA PROGRAMMABLE GRAPHIC LC-DISPLAY WITH 128X64 PIXEL, 64K FLASH MEMORY, ANALOG KEYBOARD SUPPORT, RS232-INTERFACE, I²C-INTERFACE, 12 GPIO AND SOFT REALTIME SUPPORT

- **Virtual Machine Core**
 - 8 Bit JAVA™ bytecode execution engine
 - 16 Bit processing word length
 - Max. 256 constant pool entries
 - 2.5k JAVA heap memory
 - 2 MIPS native core speed
 - Automatic garbage collection
 - Multi-threading support with extensions for soft realtime execution
- **Display**
 - 128x64 pixel graphic LCD
 - FSTN technology
 - Optional backlight
 - Viewing area: 46.0 x 23.0 mm
 - Dot pitch: 0.36 mm
 - Display contrast and backlight adjustable by software
- **Flash Memory**
 - 1 bank of 64k Flash
 - 128 byte sectors
 - > 10,000 erase/write cycles
- **Analog Keyboard**
 - Decoder for up to 10 keys
 - Simple and cost-effective design with resistors
 - Only one GPIO occupied
- **Power-Supply**
 - 5V power supply
 - Current consumption: max. 25mA (with backlight)

- **Buzzer Support**
 - Controlled by PWM output
- **RS232**
 - 5-Wire RS232-Interface
 - 11 different baud rates from 300 up to 250.000bps
 - None, even or odd parity
 - Automatic flow control by XON/XOFF or RTS/CTS
- **I²C/SMBus Communication**
 - Master mode
 - 7 and 10 Bit addressing modes
- **I/O-Pins**
 - Up to 12 General-Purpose I/O Pins
 - 2 I/Os usable as PWM outputs
 - 8 I/Os usable as Analog inputs
- **Physical Dimensions**
 - Size: 76.2x41.9x9.5mm
 - Weight: 20g

DIMENSIONS AND CONNECTORS

Fig. 1: Dimensions and Connectors of the JControl/SmartDisplay

DEVICE VARIANTS

Sales Type	Power Supply	Native Core Speed	Serial Baud Rates	Flash Organization	Back-light	RTC
JControl/SmartDisplay AA11	5V	2 MIPS	300-250.000bps	512x128x1	none	Soft
JControl/SmartDisplay AB11	5V	2 MIPS	300-250.000bps	512x128x1	blue	Soft
JControl/SmartDisplay AC11	5V	2 MIPS	300-250.000bps	512x128x1	white	Soft

Table 1: Variants of the JControl/SmartDisplay

GENERAL DESCRIPTION

The JControl/SmartDisplay is a member of the JControl device family, designed as freely programmable LC-Display with 128x64 pixel and optional backlight, analog keyboard decoder, external buzzer control, communication ports (RS232 and I²C), general purpose I/Os, analog inputs and pulse width modulator outputs. All relevant signals are available by 24 pins at the left and right edge of the device (0.1" strip connectors). For evaluation purposes, an evaluation board is available.

The JControl/SmartDisplay is based on the JControl/GUI-Engine processor. The integrated JCVM8 8 Bit JAVA™ bytecode execution engine runs with 2 MIPS native speed, providing 16 Bit processing word length, 2.5k JAVA heap memory, automatic garbage collection and multi-threading software execution. Applications in the field of control, measurement and automation are supported by specific extensions for soft-realtime processing.

The JCVM8 offers a set of built-in classes, providing fundamental support of the JAVA programming language and access to all local peripheral components like LCD, analog keyboard, Flash memory etc. Extended support is given by class libraries, linked automatically to the application by the JControl/DevelopmentSuite. This mechanism saves memory space, because exclusively the required classes are loaded to the system.

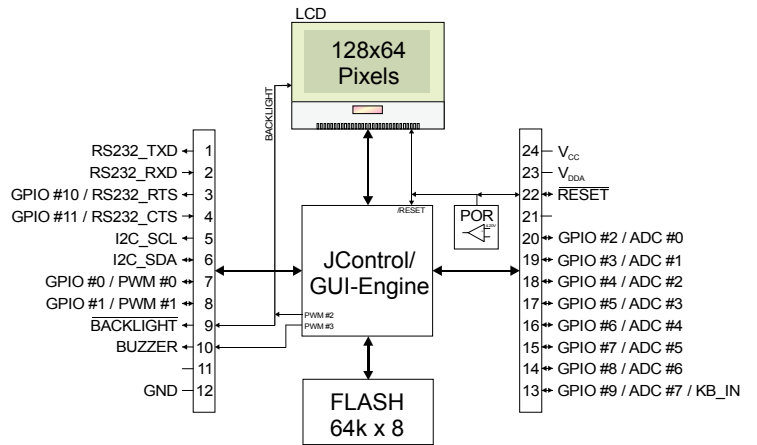

Fig. 2: JControl/SmartDisplay Block Diagram

Application programs are loaded via a serial communication interface to the Flash memory, organized as one to four banks of 64kByte. The banks may be used to store application software or non-volatile data.

Various information about the specific JControl device and its current state is available by accessing the *system properties*. In download mode, system properties may be read or written by remote using the *JControl Download Protocol*. Under normal operating conditions, the system properties can be accessed by application software using the methods `getProperty` and `setProperty` of the built-in class `jcontrol.system.Management`.

POWER SUPPLY AND SYSTEM RESET

The JControl/SmartDisplay is powered by 5V DC, connected to the pins 12 (GND) and 24 (V_{CC} = +5V) of the device. To ensure a reliable start up phase, an integrated power-on reset generator (POR) holds the reset signal of the JCVM8 and

LCD while the supply voltage is below 4.20V. When the supply voltage exceeds 4.20V, the reset signal is released and the initialization sequence of the JCVM8 is executed. When finished, the JAVA-application stored in Flash bank 0 is started.

FLASH MEMORY ORGANIZATION

Depending on the device variant, the JControl/SmartDisplay offers one to four banks of 64k Flash memory for application software or non-volatile data, labeled as Flash bank 0 to Flash bank 3 (Fig. 3). For devices with up to two flash banks, the memory is organized as 512 sectors by 128 bytes, numbered from sector 0 to sector 511. For devices with 4 Flash bank, the memory is organized as 256 sectors by 256 bytes. The Flash memory's organization may be detected automatically by reading the system property `flash.format`. The returned string comprises

the parameters `<number of sectors>x<bytes per sector>x<number of banks>` (e.g. "512x128x1" for the JControl/SmartDisplay device with one flash bank).

The Flash memory can be used to store non-volatile data using the built-in class `jcontrol.io.Flash`. It provides methods to read and write complete sectors in any bank of the Flash memory.

Fig. 3 gives an overview of bank 0's internal structure: Application software is written upwards, starting at sector 0 and non-volatile data is stored downwards, starting at sector 510 (respective sector 254 for devices with four flash banks). This

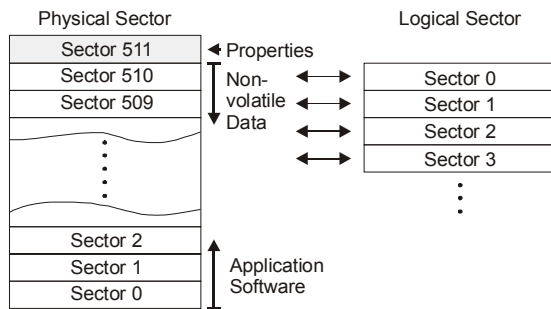

Fig. 3: Internal Structure of Flash bank 0
(For Devices with 1 or 2 Flash Banks with 512 Sectors per Bank)

procedure reduces the possibility of resource conflicts between application software and data. To offer a linear ascending number of sectors (starting at sector 0) to the application, the class `jcontrol.io.Flash` maps access to the logical sector 0 to the physical sector 510 of the Flash memory, access to logical sector 1 to the physical sector 509 and so on. The uppermost sector of bank 0 (sector 511) is used to hold non-volatile system properties. The same principle is also used for Flash Bank 1, except that the uppermost sector is not holding the system properties.

For applications that makes use of the flash memory independently of its architecture, the external class `jcontrol.storage.FlashStream` is provided. It represents a memory cached data stream for reading and writing continuous data to or from the non-volatile flash memory.

DOWNLOAD MODE

The *system download mode* is a fundamental functionality of the JCVM8, implemented in every JControl device. It is used for uploading and downloading application software or data from a host computer to the Flash memory, for auto identification of the JControl device and for reading or writing system properties by remote. The download mode is used e.g. by the development tools like *JControl/IDE* and *PropertyEdit*.

The system download mode may be entered by one of following four cases:

- (1) Directly after the initialization sequence of the JCVM8: If no valid application software is available in bank 0 of the Flash memory, the device enters the system download mode.
- (2) During normal operating conditions: If the virtual machine is restarted by the method `switchBank()` of the built-in class `jcontrol.system.Management` and the new Flash bank contains no valid application software.

Fig. 5: Entering the System Download Mode

- ① Pull signal KB_IN to GND (Pin 13), ② activate RESET signal for more than 10ms (Pin 22)

Fig. 4: Splash screen of the system download mode

- (3) The system download mode may be enforced by pulling Pin 13 (GPIO #11/KB_IN) to GND while resetting the device (as shown in Fig. 5). Refer to the chapter covering the Analog Keyboard.
- (4) The mode may also be started by software calling the `run()`-Method of an instance of the built-in class `jcontrol.system.Download`.

In the first three cases, a splash screen appears as shown in Fig. 4. The first line of the splash screen gives information about the JControl device profile ("JControl/SmartDisplay"). The second line shows the build date of the JCVM8, represented as format `yyyyMMddhhmm` (`yyyy`=year, `MM`=month, `dd`=day, `hh`=hour, `mm`=minute). The following "+0100" in the example is optional and gives information about the time zone. The build date is also available as system property `profile.date` and used by the tools to select an appropriate device profile. The bottom line shows the parameters of the RS232 interface, fixed to 19200 bps, 8 data bits, no parity and 1 stop bit.

Using the Download Mode by Applications

The built-in class `jcontrol.system.Download` may be used to access or extend the download functionality by application software, e.g. to implement comfortable download or upload features for specific applications.

When the system download mode is started by software (see case 4), no splash screen appears and the baud rate is set to the value held by the system property `rs232.baudrate` (default: 19200bps). When quitting, the download mode performs a system reset when data was written to the flash memory. Otherwise it returns to the calling application. See API documentation for more information about this class.

DISPLAY

The JControl/SmartDisplay comes with a 128x64 pixel monochrome graphic LCD in FSTN technology, optionally backlit by a blue or white LED. The display has a viewing direction of 6 o'clock and is driven by a separate display controller (Samsung S6B1713), mounted as chip-on-glass circuit on the top side of the component. To obtain a high data bandwidth, the communication between JCVM8 and display is realized by an 8 bit parallel interface.

The built-in class `jcontrol.io.Display` offers a set of methods for drawing pixels, lines, rectangles, circles, images, characters and strings on the display. It implements the interface `jcontrol.io.Graphics` for hardware abstraction. Images are supported using the pixel-based JControl Image File format (JCIF, revision 0001); fonts have to be formatted using the pixel-based JControl Font Definition format (JCFD, revision 0002). The class `jcontrol.io.Display` includes a proportional system font (8 pixel font height) by default.

For detecting the display dimensions automatically, the system property `display.dimensions` returns a string comprising the parameters `<width>x<height>x<colour_depth>`, specified by "128x64x1" for the

JControl/SmartDisplay device. The coordinates of the display are organized from left to right and from top to bottom counting from 0 to size-1, see also Fig. 6.

Fig. 6: Coordinates used by the LCD-class

The display contrast may be adjusted by software using the system property `display.contrast`. The value is saved to Flash memory, assuring that it will be restored by the system during power-up. The optional blue backlight LED of the display is controlled directly by the reserved PWM channel #2 of the JControl/GUI-Engine. For improved hardware abstraction, the external class `jcontrol.io.Backlight` is provided, enabling to set the backlight in 256 steps from 0 (off) to 255 (max brightness).

ANALOG KEYBOARD

The JControl/SmartDisplay provides a decoder for *analog keyboards* of up to 10 keys. Analog keyboards are designed as switched resistor ladders, generating a specific voltage for every key. This mechanism reduces the complexity required to realize a keyboard to a minimum.

For the JControl/SmartDisplay, GPIO #11 is used for connecting the analog keyboard (this pin is also labeled as `KB_IN`). GPIO #11 is internally connected to analog channel #7. The system software measures the voltage at the analog channel every 16ms, corresponding to a keyboard request rate of 62.5Hz. The built-in class `jcontrol.io.Keyboard` provides methods for reading the switch on character basis, including

raw access, buffered access, automatic repetition and acoustic feedback.

Fig. 7 shows the schematic of a simple cursor-control key panel connected to the JControl/SmartDisplay, realizing the keys up, down, left and right. The pull-up resistor R1 (10kΩ) is used to apply a quiescent voltage of V_{DDA} (analog reference voltage) to the analog channel, representing the passive state when all keys are released. Every keypress creates a specific voltage divider, composed by R1 and a chain of resistors from R2 to the resistor connected to the corresponding key. The resulting voltage is measured via analog channel #7 (`KB_IN`).

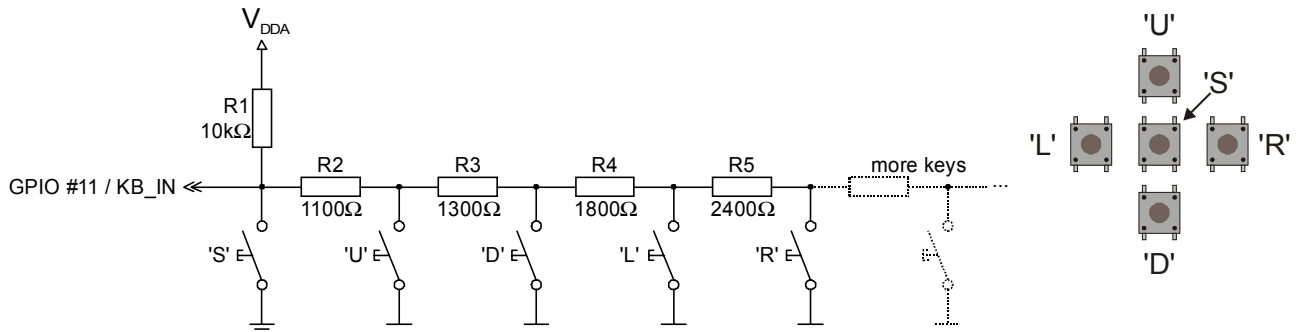

Fig. 7: Schematic of a cursor-control analog key panel

Table 2 lists resistor values for an analog keyboard with up to 10 keys, using a pull-up resistor R1 of 10kΩ. The voltage created by the voltage dividers is increased by steps of $V_{DDA}/10$, starting at 0V. Because of resistor tolerances, the resulting voltages and hence the measured ADC value may differ in real applications. Hence, the integrated keyboard decoder uses thresholds between two theoretical values for key detection.

The keys decoded by the key panel shown in Fig. 7 are up, down, left, right and select, corresponding to the letters 'U', 'D', 'L', 'R' and 'S'. The letters are returned by the method `read()` of the class `jcontrol.io.Keyboard`, when one of the keys is pressed. The letters are defined by the default keyboard map, that may be changed by an application program for software compatibility reasons.

Note that the keyboard is prioritized, this means that always the key with the lowest order number is decoded when two keys are pressed simultaneously. The first key (letter 'S') is also

used to enter the download mode when pressed during reset (s.a.).

Key Nr.	Letter	R	Resistor Value	V	ADC Value
1	'S'		0Ω	0	0
2	'U'	R2	1100Ω	0.5	25
3	'D'	R3	1300Ω	1.0	50
4	'L'	R4	1800Ω	1.5	76
5	'R'	R5	2400Ω	2.0	102
6	'N'	R6	3300Ω	2.5	127
7	'P'	R7	5100Ω	3.0	153
8	'E'	R8	8200Ω	3.5	179
9	'H'	R9	16000Ω	4.0	204
10	'X'	R10	51000Ω	4.5	230

Table 2: Resistor values for the Analog Keyboard

Analog keyboards are not suitable for silicone rubber keys, because of their varying and pressure-dependent contact resistors. Use external hardware to reduce the contact resistor in this case, e.g. logic buffers.

REAL TIME CLOCK (RTC)

The JControl/SmartDisplay implements a software emulated Real Time Clock (RTC), controlled by the system software. Hence, this "RTC" is clocked by the on-board ceramic resonator. It provides year, month, day, weekday, hours, minutes and seconds. Besides the current time, an alarm time is also provided. When the current time reaches the alarm time, a dedicated alarm flag is set.

The built-in class `jcontrol.system.RTC` implements methods for reading and writing the current time and the alarm time. A time information is represented by an instance of the built-in class `jcontrol.system.Time`, combining the fields year, month, day, weekday, hours, minutes and seconds.

BUZZER CONTROL

The JControl/SmartDisplay supports an external buzzer, connectable to pin 10 of the device. The buzzer may be used for acoustic signals generated by the system or by an application.

The system will use the buzzer for acoustic feedback on switch events and for signalling system exceptions. Both features may be enabled or disabled by the system properties

`buzzer.systembeep` and `buzzer.keyboardbeep`. Additionally, an application software may control the buzzer using the external class `jcontrol.io.Buzzer`, implementing the interface `jcontrol.io.SoundDevice` for hardware abstraction. This class provides methods to activate the buzzer using a specified frequency (250...32767Hz) for a specified duration (in ms).

JControl/SmartDisplay

The system property `buzzer.enable` is provided to enable or disable the buzzer when it is used by an application. Furthermore, the external class `jcontrol.toolkit.iMelody` is provided, playing complete melodies given by the iMelody-Format (IMY, published by the Infrared Data Association, IrDA). The buzzer output is connected internally to the reserved PWM channel #3.

As buzzer, a simple piezo element may be used, connected directly to Pin 10. When a magnetic loudspeaker should be utilized, please provide a transistor for boosting the output signal and a free wheeling diode to block reverse voltages generated by the coil.

RS232 COMMUNICATION

The JControl/SmartDisplay provides a serial communication interface with CMOS/TTL levels. The signals are available at pin 1 (output signal TXD) and pin 2 (input signal RXD) of the device. Optionally, two signals for flow control are available at pin 3 (output signal RTS) and pin 4 (input signal CTS).

The built-in class `jcontrol.comm.RS232` provides methods for reading, writing and configuring the RS232 interface. It supports buffered read access and operates on `byte`, `char`, `string` and `utf8` basis. Automatic echoing is also supported by the `readLine()` method.

The RS232 communication interface supports 11 different baud rates, starting from 300 up to 250.000bps. This includes the MIDI-baud rate of 31250bps. The baud rate is changed using the method `setBaudrate()` of the built-in class `jcontrol.comm.RS232` (see Table 3 for a list of all valid settings). When an application attempts to set an unsupported baud rate, always the fall-back setting 19200bps is used. When no baud rate value is set by the application, the default value specified by the system property `rs232.baudrate` is used.

Baud Rate	Parameter for <code>setBaudrate</code>	Comment
300	300	
600	600	
1200	1200	
2400	2400	
4800	4800	
9600	9600	
19.200	19200	Fall-back setting
31.250	31250	MIDI
62.500	62	
125.000	125	
250.000	250	

Table 3: Supported Baud Rates

Additionally, the RS232 communication interface supports a parity bit (9th data bit) as well as flow control (by `XON/XOFF` or `RTS/CTS`). All options are defined by the current *communication parameters*, configured using method `setParams()` of the built-in class `jcontrol.comm.RS232`. As shown in Fig. 8, the options are combined to a single bitmask. Appropriate constant field values are defined by the class `jcontrol.comm.RS232`. When the parameters are not changed by the application software, always the default settings specified by the system property `rs232.params` are used.

The following parity modes are supported: "8N1" (8 data bits, no parity, 1 stop bit), "8E1" (8 data bits, even parity, 1 stop bit) and "8O1" (8 data bits, odd parity, 1 stop bit). For flow control, two different modes are supported: Software flow control (by `XON/XOFF`) and hardware flow control (by `RTS/CTS`). Software flow control uses the ASCII-codes `XON` (0x11) and `XOFF` (0x13). Hardware flow control is realized by the external signals `RS232_RTS` (pin 3) and `RS232_CTS` (pin 4) of the JControl/SmartDisplay.

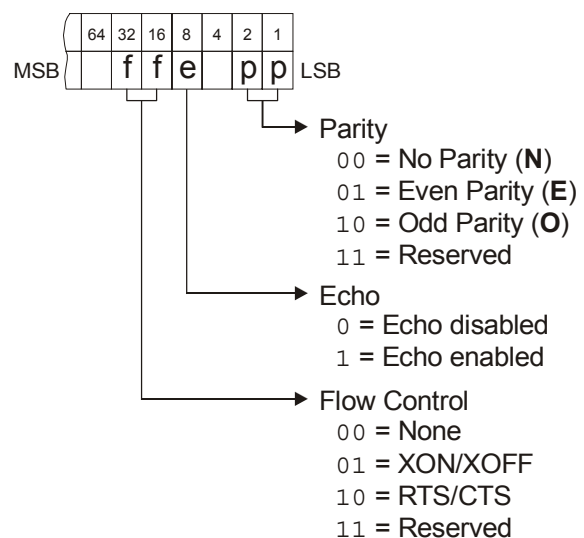

Fig. 8: RS232 Communication Parameters

I/O PINS (GPIO, PWM, ADC)

The JControl/SmartDisplay provides 12 universal I/O signals for external hardware control (though the processor itself provides up to 16). Each signal is available as General Purpose I/O (GPIO), numbered as GPIO #0 to GPIO #15 (this numbering results from compatibility issues respecting the JControl/GUI-Engine). The built-in class `jcontrol.io.GPIO` is provided to control the I/Os, supporting four different configuration modes:

- **FLOATING:** Standard digital input
- **PULLUP:** Digital input with integrated pull up resistor (60k-240kΩ, can not be influenced)
- **PUSHPULL:** Standard digital output
- **OPENDRAIN:** Digital output, set to high-impedance state when HIGH

The output current for any pin must not exceed 25mA, independtly of its usage (either source or sink).

Four of the 16 GPIO pins are also connected to an integrated Pulse Width Modulator (PWM) with a resolution of up to 8 bits. This feature is controlled by the built-in class `jcontrol.io.PWM`. The generated signals are available via the PWM channels 0 to 3. The device uses a single frequency generator for all

channels, hence the frequency of the channels has to be the same. The duty cycle of every PWM channel may be adjusted individually. Please note that every pin configured as PWM output is not available as GPIO. **ATTENTION:** PWM channel 2 is hardwired to the backlight LED of the LCD, which may have an effect on peripheral hardware connected to this pin.

Furthermore, eight pins are connected to the internal 8-bit A/D converter and may be used as analog inputs. The built-in class `jcontrol.io.ADC` is provided to control this feature. When a pin is used as analog input, it should be configured to **FLOATING** mode using the class `jcontrol.io.GPIO`. The reference voltage for the ADC channels is to be connected to pins V_{DDA} (high potential; pin 23) and GND (low potential; pin 12) and may not exceed the supply voltage.

Table 4 provides an overview on the features of each pin. Two of the listed GPIOs (#12 and #13) are provided to control the RS232 hardware flow signals `RTS` and `CTS`. Refer to chapter "RS232 Communication" for more information about this topic.

(See datasheet "JControl/GUI-Engine" for further information about the GPIOs.)

Device Pin ¹⁾	GPIO #	PWM #	ADC #	Alternate function	GPIO configurations ²⁾

⁴⁾ **GPIO #15** only available in combination with flash format **512x128x1** or **512x128x2**

I²C COMMUNICATION

A separate I²C/SMBus communication interface is available at the extension port of the JControl/SmartDisplay.

The I²C bus is a de facto standard for on-board inter integrated circuit communication. It was developed by Philips Semiconductors in the early 1980's. Many integrated circuits are supporting the I²C bus. SMBus is a kind of extended I²C bus, developed by Intel in 1995 as System Management Bus. It is used e.g. in personal computers and servers for low-speed system management communications. Mostly, the SMBus is used to interconnect the sensors for temperatures, voltages, rotation speed of fans etc.

The built-in class `jcontrol.comm.I2C` provides methods for using the JControl device as bus master. It supports 7 bit and 10 bit addressing schemes as well as reading and writing single chars or byte streams. It implements a simple hardware layer, therefore any bus error and any arbitration lost results in an `IOException` after a few retries. To avoid blocking, the class implements a bus timeout (in contrast to the I²C bus specification).

The signal `I2C_SCL` (pin 5) is the clock signal of the I²C bus (or `SMBCLK` of SMBus). The signal `I2C_SDA` (pin 6) is the data signal of the I²C bus (or `SMBDAT` of SMBus).

JCVM8 RESTRICTIONS

Not all JAVA features are implemented by the JCVM8. The following list gives an overview on the restrictions:

- Data type `int` is limited to 16 bit processing word length (not 32 bit)
- Data types `long`, `float` and `double` are not implemented. When used, one of the following two error codes is generated (context dependent):
 - `BytecodeNotSupportedError` (6)
 - `UnsupportedArrayTypeError` (9)
- The number of constants in the constant pool is limited to 255 (will be checked by the `JCManager` before upload)

- Cast check for primitive arrays is not supported and causes an error (`NotImplementedError`)
- It is not possible to call object methods on primitive arrays, e.g.

```
new int[25].equals(myObject)
```
- Some exceptions can not be caught by an application, because they generate an error code. When thrown, the JCVM8 is restarted in error condition and the error handler is called (see also chapter *Error Codes*).
- Implementation of classes in the package `java.lang` is incomplete (see JControl JAVADOC)

ERROR CODES

When an exception is thrown and not handled by the application, the JCVM8 generates an error code. Some of the errors (listed in the following Table 5) are specific to the JCVM8 and not common in the JAVA programming language (labeled with ¹). Other error codes are *masked exceptions*, because they are generated instead of an exception (labeled with ²).

Every error restarts the JCVM8 in error condition. Afterwards the method `onError()` of the built-in

class `jcontrol.system.ErrorHandler` is invoked. More details about the error state is passed by parameters to the `onError()` method.

The built-in error handler may be overwritten by a user-defined error handler stored in Flash bank 0. See the error handler included in the SystemSetup software for demonstration.

Following table gives an overview on the error codes generated by the JCVM8.

ID	Name	Description
1	<code>HandleError</code> ¹⁾	Internal VM error
2	<code>NullPointerException</code> ²⁾	Attempt to use NULL where an object is required
3	<code>OutOfMemoryError</code>	Generated when no memory is available
4	<code>BytecodeNotAvailableError</code> ¹⁾	Attempt to execute an invalid bytecode
5	<code>BytecodeNotSupportedError</code> ¹⁾	Attempt to execute an unsupported bytecode, e.g. bytecodes for 64-bit arithmetic or floating point processing
6	<code>BytecodeNotDefinedError</code> ¹⁾	Attempt to execute an undefined bytecode
7	<code>ArithmeticException</code> ²⁾	Exception during arithmetic processing, e.g. division by zero
8	<code>NegativeArraySizeException</code> ²⁾	Attempt to create an array with negative size
9	<code>UnsupportedArrayTypeError</code> ¹⁾	Arrays of this type are not supported
10	<code>ArrayIndexOutOfBoundsException</code> ²⁾	Array index is out of bounds
11	<code>ClassCastException</code> ²⁾	Attempt to cast an object which is not of an appropriate runtime type
12	<code>NoCodeError</code> ¹⁾	Thrown when a method is called that implements no code
13	<code>WaitForMonitorSignal</code> ¹⁾	Used internally by the VM
14	<code>ExternalNativeError</code> ¹⁾	Generated when a native method is called that is not stored in ROM
15	<code>FatalStackFrameOverflowError</code> ¹⁾	Generated when the stack size is not sufficient
16	<code>InstantiationException</code> ²⁾	Attempt to instantiate an abstract class or interface
17	<code>IllegalMonitorStateException</code> ²⁾	E.g. when a wait is called without an appropriate monitor
18	<code>UnsatisfiedPrelinkError</code> ¹⁾	Error due to a failed prelinking process
19	<code>ClassFormatError</code> ¹⁾	Generated by an invalid class
20	<code>ClassTooBigError</code> ¹⁾	The size of a class exceeds the limitations
21	<code>PreLinkError</code> ¹⁾	Error due to a failed prelinking process
22	<code>PreLinkedUnresolvedError</code> ¹⁾	Error due to a failed prelinking process
23	<code>UnsupportedConstantTypeError</code> ¹⁾	Generated when the type of a constant is not supported by the JCVM8 (long, float or double)
24	<code>MalformattedDescriptorError</code> ¹⁾	Error while dereferencing constant pool, e.g. due to wrong class file format
25	<code>RuntimeRefTableOverrunError</code> ¹⁾	More class references used than specified in a class file
26	<code>NoSuchFieldError</code>	Referenced field not found
27	<code>IllegalAccessError</code>	Tried to access a field or method from wrong scope (e.g. private)
28	<code>NoSuchMethodError</code>	Could not find referenced method
29	<code>TooMuchParametersError</code> ¹⁾	A method uses more parameters than supported by the JCVM8 (max. 16)
30	<code>ThrowFinalError</code> ¹⁾	Uncatched user defined exception. Exception name

ID	Name	Description
		is passed to the <code>onError()</code> method
31	<code>NoClassDefFoundError</code> ¹⁾	Unable to find a class by name
32	<code>IndexOutOfBoundsException</code> ²⁾	Thrown by some methods using String or array parameters and indices that are out of bounds
33	<code>ArrayDimensionError</code> ¹⁾	Generated when an array is created with more than 2 dimensions (only 1 and 2 dimensions supported)
34	<code>DeadlockError</code> ¹⁾	Generated by the JCVM8 scheduler when two or more threads inheriting from each other
35	<code>IncompatibleClassChangeError</code>	Generated when an interface is invoked for an object, that is not implementing the interface
36	<code>NotImplementedError</code> ¹⁾	Generated when an unimplemented JAVA feature is used

Table 5: Error Codes generated by the JCVM8

¹⁾ Error codes generated exclusively by the JCVM8. Not common in the JAVA programming language.

²⁾ JCVM8 error codes generated by the JCVM8 instead of exceptions. Can not be handled by an exception handler. May be replaced by JAVA exceptions in future revisions of the JCVM8.

SYSTEM PROPERTIES

System properties providing specific information about the JControl device. All properties are identified by a fixed string (the content is always formatted as string). The properties may be read or written using the methods `getProperty()` and `setProperty()` of the built-in class `jcontrol.system.Management`. In download mode, the tool `PropertyEdit` may be used to read or write the properties by remote.

The system properties are categorized into ROM properties and non-volatile properties. ROM properties are stored in read-only memory of the device and can not be changed. Non-volatile properties are held in the upper sector of Flash bank 0 and may be changed by software.

Key	Type	Value	Description
<code>profile.name</code>	String	"JControl/SmartDisplay"	JControl Profile Name
<code>profile.date</code>	String	"{yyyyMMddhhmm}"	Date of JCVM build
<code>system.heapsize</code>	Int	2688	Size of internal JAVA heap memory
<code>flash.format</code>	String	"512x128x1"	Flash Organization (bytes x blocks x banks)
<code>io.gpiochannels</code>	Int	16	Number of GPIO channels
<code>io.pwmchannels</code>	Int	4	Number of PWM channels
<code>io.adcchannels</code>	Int	8	Number of ADC channels
<code>display.dimensions</code>	String	"128x64x1"	Display dimensions (width x height x colour_depth)

Table 6: ROM Properties (saved in ROM, read access only)

Key	Type	Range	Default	Description
<code>system.userbank</code>	Int	0..1	0	Flash bank used for user application
<code>rtc.poweronbank</code>	Int	0..1	0	Bank selected to start application after power on initiated by RTC alarm
<code>buzzer.enable</code>	Bool	true, false	true	Enable or disable buzzer to be used by application software
<code>buzzer.systembeep</code>	Bool	true, false	true	Enable or disable system sound (set independent from <code>buzzer.enable</code>)

Key	Type	Range	Default	Description
buzzer.keyboardbeep	Bool	true, false	true	Enable or disable keyboard beep (set independent from buzzer.enable)
display.contrast	Int	0..255	42	LCD contrast adjustment
rs232.params	Int	(see section RS232 Communication: Figure 8)	0	Bitmask holding RS232 configuration <ul style="list-style-type: none"> ▪ Bit 1:0 00 = No Parity 01 = PARITY_EVEN enabled 10 = PARITY_ODD enabled ▪ Bit 3 1 = ECHO enabled ▪ Bit 5:4 00 = No flow control 01 = FLOWCONTROL_XONOFF enabled 10 = FLOWCONTROL_RTSCTS enabled
rs232.baudrate	Int	(see section RS232 Communication: Table 3)	19200	Sets default RS232 Baudrate

Table 7: Non-Volatile Properties (saved in Flash, read and write access)

SUPPORTED DATA FORMATS

The device supports following data formats:

Format used for	Format suffix	Rev.	Description	Used by class	Editor
Images	JCIF	0001	JControl Image File 8-Bit pixel-based image definition format	jcontrol.io.Display	PictureEdit
Fonts	JCFD	0002	JControl Font Definition 8-Bit pixel-based font definition format	jcontrol.io.Display	FontEdit
Melodies	IMY	V1.2	iMelody Melody format specified by Infrared Data Association (IrDA)	jcontrol.toolkit.iMelody	MelodyEdit

Table 8: Supported Data Formats for the JControl/SmartDisplay

The format specifications are available online at <http://www.jcontrol.org>.

SUPPORTED JAR LIBRARIES

The device supports base JAR Libraries as listed below:

JCVM8 Build Date	Path	Type	Description
20030722	JControl/profiles/jar/...		
	builtin/JControl_SmartDisplay_20030722.jar	built-in	Library of all classes provided internally
	standard/JControl_ALL_20030620_lib.jar	standard	Standard JControl API programming environment
	optional/JControl_vole_20030620.jar	optional	Vole Graphical User Interface package

Table 9: Base JAR libraries supported by versions of the JControl/SmartDisplay

BUILT-IN PACKAGES

Summary of Packages

Package	Description
<code>jcontrol.comm</code>	Complex communication features for JControl.
<code>jcontrol.io</code>	Classes for basic I/O and peripheral control.
<code>jcontrol.lang</code>	Replacement classes, fundamental to the design of the JAVA programming language.
<code>jcontrol.system</code>	JControl core classes and JControl specific JAVA extensions.
<code>java.lang</code>	Provides classes that are fundamental to the design of the Java programming language. Subset of the standard-package <code>java.lang</code> .
<code>java.io</code>	Subset of the standard <code>java.io</code> -package (only <code>java.io.IOException</code>)

Packages in Detail

Name	Type	Description
Package <code>jcontrol.comm</code>		
<code>ConsoleInputStream</code>	Interface	Provides a set of high-level communication methods to read from a console.
<code>ConsoleOutputStream</code>	Interface	Provides a set of high-level communication methods to write to a console
<code>RS232</code>	Class	Implements RS232 communication for JControl
Package <code>jcontrol.io</code>		
<code>ADC</code>	Class	Control of JControls analog-digital converter. Used to measure the voltage at portpins connected to the internal A/D converter
<code>BasicInputStream</code>	Interface	Interface providing a set of low-level communication methods for reading from a stream
<code>BasicOutputStream</code>	Interface	Interface providing a set of low-level communication methods for writing to a stream
<code>ComplexInputStream</code>	Interface	Interface providing a set of high-level communication methods for reading from a stream
<code>ComplexOutputStream</code>	Interface	Interface providing a set of high-level communication methods for writing to a stream
<code>Display</code>	Class	Class to control the on-board 128x64 BW-LC-Display. Coordinates are from left to right and from top to bottom counting from 0 to size-1.
<code>Drawable</code>	Interface	Defines Object-behaviour for use with <code>jcontrol.io.Display.drawImage()</code>
<code>File</code>	Interface	Provides a set of methods for file-system access
<code>Flash</code>	Class	Raw access to JControl's integrated Flash memory. The methods are designed to access complete sectors of memory, not single bytes.
<code>Graphics</code>	Interface	Interface definition for graphics devices (e.g. offscreen images, displays, ...)
<code>I2C</code>	Class	Controls I ² C devices connected to JControl.
<code>Keyboard</code>	Class	Accesses JControl's keyboard, the analog keyboard in the case of the JControl/SmartDisplay
<code>Portpins</code>	Class	Controls available portpins of JControl
<code>PWM</code>	Class	Controls the Pulse Width Modulation outputs of JControl

Name	Type	Description
Resource	Class	Implements read access to the application's resource. The resource stores additional application data like pictures, fonts, text etc.
Package jcontrol.lang		
Deadline	Class	Constructs a new JControl deadline, useful for soft real-time applications
ThreadExt	Class	Thread extensions for JControl, useful for soft real-time applications
Math	Class	Provides some simple math functions
Package jcontrol.system		
Download	Class	Manages to download new JAVA applications to a JControl module
ErrorHandler	Class	The JControl Error-Handler. May be overwritten to implement more comfortable error handlers.
Management	Class	Controls various system management functions
RTC	Class	Access to JControl's integrated Real Time Clock
Time	Class	The Time object stores a date and time.
Package java.lang		
Exception	Class	The class <code>Exception</code> and its subclasses are a form of <code>Throwable</code> , indicating conditions that a reasonable application might want to catch
Integer	Class	The <code>Integer</code> class wraps a value of the primitive type <code>int</code> in an object. An object of type <code>Integer</code> contains a single field whose type is <code>int</code> .
Object	Class	Class <code>Object</code> is the root of the class hierarchy. Every class has <code>Object</code> as a superclass. All objects, including arrays, implement the methods of this class.
Runnable	Interface	The <code>Runnable</code> interface should be implemented by any class whose instances are intended to be executed by a thread. The class must define a method of no arguments called <code>run</code> .
String	Class	The <code>String</code> class represents character strings. All string literals in JAVA programs, such as <code>"abc"</code> , are implemented as instances of this class
Thread	Class	A <code>Thread</code> is a thread of execution in a program. The JAVA Virtual Machine allows an application to have multiple threads of execution running concurrently.
Throwable	Class	The <code>Throwable</code> class is the superclass of all errors and exceptions in the JAVA language. Only objects that are instances of this class (or one of its subclasses) are thrown by the JAVA Virtual Machine or can be thrown by the JAVA <code>throw</code> statement. Similarly, only this class or one of its subclasses can be the argument type in a <code>catch</code> clause.

MECHANICAL DATA

Fig. 9: Mechanical Data of JControl/SmartDisplay
(All sizes in mm)

PIN ASSIGNMENT

Pin	Name	Description
1	RS232_TXD	Transmit Data output of RS232 interface
2	RS232_RXD	Receive Data input of RS232 interface
3	GPIO #12 RS232_RTS	<ul style="list-style-type: none"> ▪ GPIO channel #12 ▪ Input modes: PULLUP ▪ Output modes: - ▪ Ready To Send handshake output of RS232 interface
4	GPIO #13 RS232_CTS	<ul style="list-style-type: none"> ▪ GPIO channel #13 ▪ Input modes: FLOATING or PULLUP ▪ Output modes: PUSH_PULL or OPENDRAIN ▪ Clear To Send handshake input of RS232 interface
5	I ² C_SCL	Clock Signal of I ² C-Bus (SMBCLK of SMBus)
6	I ² C_SDA	Data Signal of I ² C-Bus (SMBDAT of SMBus)
7	GPIO #0 PWM #0	<ul style="list-style-type: none"> ▪ GPIO channel #0 ▪ Input modes: FLOATING or PULLUP ▪ Output modes: PUSH_PULL or OPENDRAIN ▪ PWM channel #0
8	GPIO #1 PWM #1	<ul style="list-style-type: none"> ▪ GPIO channel #1 ▪ Input modes: FLOATING or PULLUP ▪ Output modes: PUSH_PULL or OPENDRAIN ▪ PWM channel #1
9	GPIO #2 PWM #2 /BGLIGHT	<ul style="list-style-type: none"> ▪ GPIO channel #2 ▪ Input modes: FLOATING or PULLUP ▪ Output modes: PUSH_PULL or OPENDRAIN ▪ PWM channel #2 ▪ BACKLIGHT LED control output ▪ Internally connected to PWM channel #2 and to the LCD backlight LED

Pin	Name	Description
10	GPIO #3 PWM #3 BUZZER	<ul style="list-style-type: none"> ▪ GPIO channel #3 <ul style="list-style-type: none"> ▪ Input modes: FLOATING ▪ Output modes: PUSH_PULL or OPENDRAIN ▪ PWM channel #3 ▪ Buzzer control output <ul style="list-style-type: none"> ▪ Internally connected to PWM channel #3
12	GND	Ground Voltage (also low potential of the analog reference voltage)
13	GPIO #11 ADC #7 KB_IN	<ul style="list-style-type: none"> ▪ GPIO channel #11 <ul style="list-style-type: none"> ▪ Input modes: FLOATING or PULLUP ▪ Output modes: PUSH_PULL or OPENDRAIN ▪ ADC channel #7 ▪ Analog Keyboard Input
14	GPIO #10 ADC #6	<ul style="list-style-type: none"> ▪ GPIO channel #10 <ul style="list-style-type: none"> ▪ Input modes: FLOATING or PULLUP ▪ Output modes: PUSH_PULL or OPENDRAIN ▪ ADC channel #6
15	GPIO #9 ADC #5	<ul style="list-style-type: none"> ▪ GPIO channel #9 <ul style="list-style-type: none"> ▪ Input modes: FLOATING or PULLUP ▪ Output modes: PUSH_PULL or OPENDRAIN ▪ ADC channel #5
16	GPIO #8 ADC #4	<ul style="list-style-type: none"> ▪ GPIO channel #8 <ul style="list-style-type: none"> ▪ Input modes: FLOATING or PULLUP ▪ Output modes: PUSH_PULL or OPENDRAIN ▪ ADC channel #4
17	GPIO #7 ADC #3	<ul style="list-style-type: none"> ▪ GPIO channel #7 <ul style="list-style-type: none"> ▪ Input modes: FLOATING or PULLUP ▪ Output modes: PUSH_PULL or OPENDRAIN ▪ ADC channel #3
18	GPIO #6 ADC #2	<ul style="list-style-type: none"> ▪ GPIO channel #6 <ul style="list-style-type: none"> ▪ Input modes: FLOATING or PULLUP ▪ Output modes: PUSH_PULL or OPENDRAIN ▪ ADC channel #2
19	GPIO #5 ADC #1	<ul style="list-style-type: none"> ▪ GPIO channel #5 <ul style="list-style-type: none"> ▪ Input modes: FLOATING or PULLUP ▪ Output modes: PUSH_PULL or OPENDRAIN ▪ ADC channel #1
20	GPIO #4 ADC #0	<ul style="list-style-type: none"> ▪ GPIO channel #4 <ul style="list-style-type: none"> ▪ Input modes: FLOATING or PULLUP ▪ Output modes: PUSH_PULL or OPENDRAIN ▪ ADC channel #0
21	N.C.	Not connected (reserved for future use)
22	/RESET	Reset input, active low
23	V _{DDA}	Reference voltage for ADC channels (high potential)
24	V _{CC}	Power Supply (5V DC)
